A Reduced Feature based Machine learning Approach for Software Defect Prediction (B.Sc)

Critical fields like medicine, airline, and banking require high-quality quality reliable software as failure in these systems may cost people's lives and cause huge financial losses. Software defect prediction approaches are utilized when a product organization needs to convey a completed item while it has a restricted time and spending plan for testing it.

A Hybrid Approach for Improved Electric Short Term Load Forecasting (M.Sc)

For the daily management and planning of power grids, short-term load forecasting (STLF) is a crucial task in power systems. In STLF, the electrical load demand is forecasted from a few hours to several days in advance. For the power grid to remain stable and reliable, to avoid overloading or underutilizing power plants, and to maximize energy management tactics, accurate STLF is important.

Awards

Project Fair

2nd Runner-up in Object Oriented Project in the project fair(Unity Based)

Certifications

Web Development with PHP & Laravel

Certificate of Completion PHP Laravel Course

Interests

Interests

Reading Book, Travelling,
